Direct Transfer Coal Facility- Water Management Plan Addendum

This Addendum outlines the specific details affected in the "Direct Transfer Barge Facility-Water Management Plan" (August 2014) as a result of the proposed amendments (reference Amendment description) for the conditionally permitted Direct Transfer Coal Facility.

Please note that other changes may be made as a result of current pending discussions with Metro Vancouver; however these changes have not been included in this document as they are not related to FSD's project amendment application.

Amendments to *Water Management Plan dated August 2014*

1. All references to *Direct to Barge coal transfer facility* to be changed to "Direct Coal Transfer Facility"
2. All references to *Barge Loader* to be changed to "Vessel loader"
3. Replace drawing 2113-SK002A (Rev P1) with 2113-SK002A (Rev P2)
4. The containment area configuration has been changed as per revised drawing 2113-SK002A (Rev P2) attached. This has resulted in a slight decrease in the contained area from 5,340 m² to 3,680 m²

Consequently Section 2.10 has been updated as per the following:

Section 2.10 Volumes of Discharge Water

Replace:

A = area. The process area is 4,100 m²

With:

A = 3,680 m². Hydraulic calculations are based upon the original larger area of 4,100 m² which will be conservative and therefore are not being revised.
